

X-Ray Workflow

- Confirm patient ID, orientation and film quality
- Draw a line down the surface of the humerus in the lateral view, should intersect middle 1/3 of the capitellum
- Draw line along radial neck, should intersect with capitellum
- To help identify subtle injuries, check the cortex of each bone in the elbow
- Check for a lucent crescent of fat (posterior fat pad) in the olecranon fossa → effusion

Most Common Pediatric Elbow Fractures

1. Supracondylar Humerus Fracture (50-70%)
Features: Anterior humeral line does not intersect capitellum, + posterior fat pad + anterior fat pad
2. Lateral Condyle Fracture (10-15%)
Features: Fracture line starting at lateral distal humerus which crosses physis
3. Medial Epicondyle Fracture (~10%)
Features: Posterior ulnar and radial dislocation, physis involvement

Ossification Center Development
